Assignment & 1) what are the data types in python? Explain. The data types defined in the python are; 1. Numbers James Tolking 2. vstring 3. List of 1511 all of college as olgot A. solgeit a Hittiple II with more calls algorithm 1911 agras. s. Dictionary Numbers: Number store numeric value Python supports 4 types of numeric data l'int (signed integers like 10,2,29 etc) 2. long (long integers used for all higher range of values like 908090800L etc) . ((1:11)1:) turn 3. float. (It is used to store floating point numbers 4. Complex Complex numbers like 2th i) vistring. The string can be defined as the sequence of characters represented in the quotation marks. In Python use use single, double ou triple quotes to define a string (i) !! " !=1") tring Eg: "hello woold" List: List are similar to arrays in C. However, the list contain data of different types. The items stored in the list are separated with

we can use slice[i] operators to access the data of the list. Eg: 1= [1,"hi", "python", 2] Print (1 [3:3) OP [2] Tuple: A tuple is similar to the list in many ways. Like lists, Tuple also contain the collection Of the items of different data types. The items Of tuple are separated with a commac,) and: enclosed in the parentheses() Eg: += ("hi" : "Python", 2)

Print (+CI: 3): . Lette I parage so

O/P: ('Python',/2)

Dictionary: Dictionary is an ordered set of a key-value pair of items. It is like an associative array key can hold any primitive data type whereas value is an arbitary Python object. 89: d= \$1: 1:mmg", 12: Alex, 3: 10hn3: Print ("1st name is" +d[1])

Sall is south for a ration, in a dark middle in 1951

Olp: 1st name is simmy

Disrietly explain history of python.

Python is a widely used general - purpose.

Initially designed by Guido van Rossum initially designed by Python Software foundation

1991 and developed by Python Software foundation

Of code.

Of code.

Of code.

In the late 1980's, history was about to written . It was that ty time when working on python stanted woon after that, Guido van Rossum began doing its application based work in dec of 1989 by at centromwiskunde and Informatica Genis which is situated in Retherland. It was started first as a hobby Project, because he was looking for an intresting project to keep him occupied during christmas. The programming language which python is said to have succeeded is ABC programming larguage, which had the intersacing with the -Amoeba Operating system and had the feature of exception handling. He had already helped to create ABC conlier in his Concer, and he

had seen some issues with ABC but liked most of the feotures. After that what he did-as really very clever he had taken the Syntax of ABC; and some of its good featheres. It came with a lot of complaints too, 30, he fixed those issues completely and had Created a good scripting language which had removed all the flaws. The inspiration for the name came from BBC's TV Show- monty" Python's flying circus as he was a big for of the TV show, and also he wanted a short, unique and slightly mysterious name for his invention and hence he name it pathons He was the Bengvelent dictatorfor life"(BDFL), Until he. stepped down from the position as the lander on 12th July 2018, for quite some time he used to work for Google, but corrently, he is working at Dropbox. The language was, finally released in 1991. when it was released. It used a lot fewer codes to express the concepts, when we compose it with Java, card c++. Its design Philosophy was quite good too. It's main objective is to

provide code readability and advanced developed productivity when it was released of had more than enough capability to provide classes with inheritance, several core data types exception handling and functions. 3) Explain the operators in Pathon?
(i) - Arithmetic operators.
These are used to perform arithmetic operations between two operands. It includes addition(+), Subtraction(-), multiplication(+), dividus remainder (1/0); flooridivision (11) and exponent (xx) (ii) Companison Operator distribution of the These are used to compane the value of the two operands and returns boolean True or false accordingly. Tide is brem on into the mix. The companison operators are: からたっかけるこれです。こうないののではならいが (iii) Assignment operators: These are used to assign the value of the right expression to the left operand. Egot Assignment Operators: =, +=, -=; *=, %=; +x=1,1=6 . Jan 62 Will at

(iv) isituise Operators. The Bitwise Operators Personnibit by bit Operation on the values of two operands. Binary and (2) Binary (xor) (N) leftshift (< Negation (~>) Right shift(>>) Binary Or (1) (V) Logical Operators: These one used to person primonily in the expression evaluation to make a decision OPATHON Supports and our, not logical operator (Vi) Membership Operators: hit dus in militable These are used to check the membership of value inside a pythonoist-the value is Present in data structure, then the resulting Value is true otherwise it returns false. + in and notin are membership operators. (Vii) Identity operators: is - It is evaluated to be tive of the reference present at both side point to the same in Object is not - It is evaluated to be the if the reference present at both side do not Point to the same object.

- in explain the teathres, of python (1) Easy to learn and use Python is easy to learn and use. It is developer - trendly and high level programming language in the land has spired in a serie (2) Expressive language 1 ... duling in the and It means that is more understandable and readable. Lower Berg and South (6) Interpreter executes the code line by line at a time. This makes debugging easy and thus suitable Jor beginners point (W) cross-platform language It can run equally on different platforms! such as windows, linux, unix, et c. so we can Say Pothon is a portable language (5) free and open Source of the It is treely available at official web addres Source - code is also evallable. it is open the object Commission garages in record Source! (6) Object - Oriented language It supports object oriented language and .. Concepts of classes and objects, come into who indied old the our of it borns . while existence.
 - Scanned with ComScanner

It implies that other languages such as c/c++ can be used to compile the code and thus it, can be used further in our python code (8) Large Standard Library Pathon has large and broad library and pro rich set of module and functions for rapid. application developmenting is told comment (d) Giri budiomujud zabbort Graphical user interfaces can be developed Using ! Aython: smill which he cartes on sill i an ail-in (W) Integrated It can be easily integrated with languages like cract java etc. (5) Justify why Python is interactive interprete sported sld. 1-04 language! Python is an interacted interpreted language · boistrich by ship in because Unlike c/c++ etc, python is an interpreted Object oriented programming language. By interp Oted it is meant that each time a program is from the interpreter, checks through the Code for errors and then interprets the into machine readable byte code

we can easily integral like cicale python with other languages like cicale python with other languages like cicale. There is no need to compile python addernis makes it easier to debug our addernis makes it easier to debug our addernis this makes it easier to debug our addernis the source code of Python is converted into an immediate form called byte code.
